AUTOMATED, WRAP-AROUND TELEPHONE DIALING

ABSTRACT

[0082]   A wrap-around dialer may include a memory for storing a first long distance access code and a processor. The processor may be configured to receive a string of numbers from a dialing device and to deliver the first long distance access code and at least a portion of the string of numbers into a telephone line, if the string of numbers includes a second long distance access code. The processor may also be configured to deliver the full string of numbers into the telephone line without the first long distance access code, if the string of numbers does not include the second long distance access code. Related processes and other features are also disclosed.
